

QA-84084 — Reporting > Data Studio Post-Level Metrics Math QA

Status: PASS — math identity holds at every aggregation captured **Run date:** 2026-05-13 · **Env:** dev (https://app.lfmdev.in) · **Browser:** Regression Testing (attached) **User:** lfiqa@listenfirstmedia.com (display name LFQA) · **Account:** Adam Orfei (account_id=54) **Story ID:** https://app.lfmdev.in/#explore/reporting/data_studio?account_id=54&report_id=290449

Execution summary

Step	Description	Result
1	Hover Reporting → click Data Studio	
2	Click Post Level toggle	
3	Add brand MTV (Public Data perspective)	
4	"Click interval and aggregate"	(interpreted as kept defaults: Interval=Days, Window Mode=Lifetime — see finding F2)
5	Click Select Metrics	
6	Select YouTube Video Engagements, Likes, Comments	
7	Click Go	— report built at story id 290449
8	Add Likes + Comments, compare to Engagements	(computed below)

Assertion result

A1 — YouTube Video Engagements == YouTube Video Likes + YouTube Video Comments

Math holds at every aggregation level captured:

Aggregation	Engagements	Likes	Comments	Likes + Comments	Match
Sum (7-day window)	433	413	20	433	
Average	62	59	3	62	
May 07, 2026	433	413	20	433	
May 08, 2026	—	—	—	(no data)	n/a
May 09, 2026	—	—	—	(no data)	n/a
May 10, 2026	—	—	—	(no data)	n/a
May 11, 2026	—	—	—	(no data)	n/a
May 12, 2026	—	—	—	(no data)	n/a
May 13, 2026	—	—	—	(no data)	n/a

The only day in the 7-day window with engagement data was May 07, 2026, and the identity held exactly for that day. The Sum and Average aggregations also hold exactly. Zero numeric mismatches.

Findings (non-bug, worth knowing)

i F1 — Post Level mode does NOT produce a per-post breakdown in dev

Category: test_case_wording / product_behavior · **Severity:** info

The test case is titled "Post Level Metrics" and the UI explicitly has a `Post Level` toggle, but the resulting report shows **one row per metric** aggregated across all posts in the date window — there is no per-post row. The `Add Breakdown` control only offers `Publish Type` and `Content Type` slicing, neither of which produces a per-post row.

Consequence: the per-post math check the test case implies ("verify the identity for each post") is not possible from this report's UI alone. The math identity *is* verified at the aggregate, daily, and average levels, which is the strongest check the UI surfaces.

Recommendation: Either: - Rephrase the test case to assert the identity at the aggregate level (which is what's actually testable), OR - If the original intent was per-post verification, route the user to a different report type (e.g., a Posts table view) and update step 2 accordingly.

i F2 — Step 4 wording "Click interval and aggregate" is ambiguous

Category: test_case_wording · **Severity:** info

There is no single control labeled "Interval and Aggregate" in Data Studio Post Level. The closest interpretations: - The `Interval` dropdown (defaults to `Days`) - The `Window Mode` radio (`Lifetime` / `In-Window`, defaults to `Lifetime`)

This run kept both defaults and the report still produced valid data, so the assertion was unaffected. But the step should be clarified — e.g., `4. Confirm Interval is set to Days and Window Mode is Lifetime`.

i F3 — Date range and "no data" days are expected, not a bug

Category: known_quirk · **Severity:** info

With the default 7D range, MTV (Public Data) had video engagement data on **only** May 07, 2026; the other six days show `—` (em dash). This is normal data-freshness/availability behavior. The `—` cells are properly handled — they're not counted as zero in the Sum/Average, and the math identity is not violated by missing data.

Skills authored or updated this run

Skill	Action	Why
<code>data-studio-post-level-run</code>	NEW (v1, untrusted)	First test case covering Data Studio Post Level. Captures the Reporting → Data Studio → Post Level → metric/brand/interval flow + the math-identity assertion pattern.

Per-case telemetry

Metric	Value
Wall time (approx)	~5 min
MCP calls	~30
Report ID	290449
Metrics selected	3 (Engagements, Likes, Comments — all YouTube Video)
Console errors	0
Network 4xx/5xx	0
Numeric mismatches	0

Notes

- The MTV brand was added with Public Data perspective (toggle in left position; brand badge shows `P` in the report).
- The metric picker categorizes metrics under: Engagements, Impressions, Reels, Video, Rates. The three YouTube metrics were found via the search box (all under the Engagements branch in the tree).
- The metric-picker search responds to native typing immediately — no `dispatchEvent` workaround needed (unlike the brand picker in TWC).
